Abstract (en)  
[origin: WO2011009449A1] The invention relates to a digital access control system, comprising an input means that can be operated from the unsecured area and a passage barrier that releases in response to operation of the input means, wherein an energy store for supplying the passage barrier with release energy and a communication line for communication with a remote unit in the secured area are provided, and wherein the energy store is designed as a low-voltage buffer store and a low-voltage communication line is provided to supply power to the low-voltage buffer store, wherein a low-voltage Power-over-Ethernet unit or a unit of a similar standard is associated with the low-voltage communication line.
