Abstract (en)

[origin: WO2011009917A2] The invention relates to a device and a method for cleaning substrates on a carrier. The substrates are fixed to the bottom side of the carrier in such a way that they are arranged in parallel at a short distance from each other, said carrier comprising, on the inside thereof, a plurality of longitudinal channels extending in parallel. As the wafers are sown, the channels merge with the openings in intermediate spaces between the substrates. A relative movement enables a long tube, from which cleaning fluid is dispensed, to be introduced into one of the longitudinal channels, the relative movement being generated essentially by moving the carrier.
