Abstract (en)  
The present invention relates to a device for aiding in infant care. More particularly, the present invention proposes a device for aiding in infant care comprising: an upper body support unit for supporting the upper body of a baby; a lower body support unit for supporting the lower body of the baby with the legs of the baby being spread apart; and a stanchion for interconnecting the upper body support unit and the lower body support unit. The device of the present invention for aiding in infant care enables a user to easily care for a baby while changing diapers, clothing the baby, washing the buttocks of the baby, or the like with the baby standing up and legs spread apart.
