Abstract (en)
A modular play house connector unit comprises a plurality of sockets (111-117), each arranged to receive a rod (201,202). The connector unit also comprises at least one slot (130) for retaining a sheet (300). In use, a frame structure is assembled from a plurality of connectors and rods and one or more sheets are draped over the frame structure to form a play house. The sheet is retained in close correspondence with the shape of the frame structure by inserting the sheet fabric into the slots in the connectors, thus allowing the sheet to form walls and a roof without having a baggy appearance.
