Abstract (en)
[origin: EP2457846A2] The module has two pistons (61, 64) displaceably lying at two walls of a chamber (20) and another chamber, respectively. A coupling unit has a cylindrical part (62) for coupling the pistons with each other during discharge of components of cosmetic composition. The pistons and the part form a piston unit, where the pistons are arranged concentric to each other. The pistons have a piston head (7) initially separated from the coupling unit and irreversibly connected with the coupling unit after filling the module with a product. The chambers are filled with the respective components. The components are film former, thickener, neutralizing agent, oil, humectant, active agent, emulsifier, wax, botanical extracts, silicone, silicone derivatives, anti-corrosive agent, antioxidants or oxidation agents.
