Abstract (en)

[origin: WO2011015484A2] The invention relates to a positioning device for positioning at least two cylinders of a printing group of a printing machine. Said positioning device comprises at least one rail arrangement, and the rail arrangement comprises at least one rail and at least two carriages. Respectively one bearing connected to a journal of at least one of the at least two cylinders is arranged on each of the at least two carriages and the at least two carriages can be moved along the at least one rail and can be fixed in pre-determinable positions along the rail arrangement. The carriages can be moved and/or positioned along the rail arrangement by means of a drive selectively acting on at least one of the carriages, and/or a number of fixing elements is arranged at least along the at least one rail. The invention also relates to a method for positioning cylinders in a printing group of a printing machine.
