Abstract (en)

[origin: WO2011016796A1] A user 12 uses a master password 16 which is an authorized access key for a sender 32 to send a mail 38. The master password 16 is automatically replaced by an authorized-to-reply key 77 which is used in all subsequent mail delivery. The mail systems are using the authorized-to-reply key 77 and a permission-to-transmit key 78 to exchange mails. The master password 16 is deleted later to prevent unauthorized use, without affecting previously established mail exchanges. An unknown sender requests an authorized-to-reply key 77 through an interactive examination. The authorized-to-reply key is regenerated in a security-demanding environment. The authorized-to-reply key is sub-divided to comprise a unique group name 164 to facilitate sorting and graphic displays of the various groups. A utility program 152 searches and matches desired services and advertisements 92 with the offers from other mail users.
