Abstract (en)
[origin: WO2011015268A1] The present invention relates to electrically conductive particles which gives conductivity especially to polymer matrixes in the various applications of resin compositions. It has now been found that inorganic base materials, in particular TiO₂ particles, coated with tungsten and phosphorus doped tin oxide (TPTO), have conductivities which are sufficiently high for all uses, especially for the conductive primer of electrostatic coating on automotive plastic parts.
