Abstract (en)
[origin: EP2462832A1] The apparatus has an epilating head (10) including an epilating roller (13) arranged within an epilating chamber. The roller comprises a series of clamps opened and closed during rotation of the roller. The head comprises a flap (25) movable in rotation around the axis. The flap defines a mobile longitudinal edge (21) of an epilating window (14). The flap has a bearing bead supported on a zone to be epilated and extending in an extension of the edge opposite to the window, where the bead defines a contact surface (S) having contact with skin of the zone to be epilated.
