Abstract (en)
[origin: WO2011018525A1] The invention relates to a mop, which may be designed in particular as a floor mop and has a handle and a pressing device, which can be moved along the handle, for pressing two pivotably mounted mop plate segments against each other. The known mops have the disadvantage that the folded-together mop plate segments must be inserted into the pressing device or that the mop plate cannot be rotatably designed. The invention avoids this by the pressing device being mounted rotatably in relation to the handle.
