Abstract (en)

[origin: WO2011018204A1] The invention relates to a method for wirelessly transmitting data between at least one communication unit (2) arranged in or on a rotating component (1), having at least one sensor (S) and/or actuator connected to each unit, and at least one base communication unit (4) arranged within radio reception range outside of the rotating component. The invention relates to the transmission of data in the ultra-broad band radio transmission method (UWB) on a frequency spectrum of more than 500 MHz or a frequency bandwidth of more than 0.2 times the average transmission frequency.
