Abstract (en)
A storage container has a container body with an upwardly facing opening and a lid connected to the container body that is pivotally movable between open and closed positions. At least one latch is provided at each of the front side, left side, and right side of the container body to secure the lid to the container body. A seal structure is disposed at an interface between the lid and an upper portion of the container. The seal structure generally surrounds the upwardly facing opening and is compressed when the lid is latched in the closed position by the latches. The container body may also include a plurality of compartments each with upper edges defining an upwardly facing opening. The upper edges can be positioned to engage an inner surface of the lid when the lid is in the closed position so that the lid closes off the compartments.
