Abstract (en)

Track arranged on a series of piers and a method for constructing it. It is proposed to provide a series of piers for supporting a track such as a railway, road or the like. To this end, after arranging the piers a bearing part is arranged on at least one pier. Inside the bearing part the elements for the track are being received and coupled with the already present part of the track. Subsequently, the bearing part moves by pushing off against the constructed part of the track while leaving behind the locally formed track element that is connected to the other part of the track. Preferably, the track elements are implemented as double-decked elements such that a double-decked track arises inside of which and on top of which traffic is possible.
