Abstract (en)

An insulating member (10) for use between a window (1) and a load-bearing structure comprises a first insulating element (101) made from a dimensionally stable insulating material, a second insulating element (102) made from a compressible insulating material, and fastening means (103,104) for fastening the insulating member (10) to the window (1) or the load-bearing structure. The first and second insulating elements (101,102) are interconnected so that, when seen in the orientation of the intended use, the first insulating element (101) is on top of the second insulating element (102), and the fastening means (103,104) is attached to the first insulating element (101). The second insulating element (102) can be made from a slit material with slits extending in a height direction from a lower side. During mounting the second insulating element (102) is brought into contact with the underlying roof structure (20) and is locally compressed by battens (9) and other projections thereon.
