Abstract (en)
The preset invention relates to an implantable medical device connectable to at least three electrodes. The device comprises an immittance measurer operative to perform immittance measurements within the heart of a patient using at least three electrodes coupled to the device where at least one of said electrodes is arranged in an atrium of the patient's heart. The medical device further comprises an immittance converter operative to convert the immittance measurement values into individual near-field immittance values of at least one electrode being arranged in an atrium, an atrial dilatation detector operative to detect atrial dilatation based upon said individual near-field immittance values, and to determine atrial dilatation values in dependence thereto, and an atrial fibrillation risk determiner adapted to determine an atrial fibrillation risk index based upon said atrial dilatation values.
