Abstract (en)
[origin: WO2011023257A1] The invention relates to selectively tamping a single sleeper (8) by lowering only one of the two tamping units (5), the squeezing drives (15) of the tamping unit (4) not to be lowered are activated, said squeezing drives being associated with inner tamping tools (12). Thus, a spacing of the inner tamping picks (17) associated with the inner tamping tools (12) from the adjacent inner tamping picks (17) to be lowered of the tamping unit (5) to be lowered is achieved. Thus, the tamping unit (5) can be lowered without obstruction.
