Abstract (en)

[origin: WO2011023458A1] The invention relates to an attachment module for detection of a switching state of an electromagnetic switching device which has a switch housing in which an operating means is arranged, which is in the form of a plunger (6) and one end of which is operatively connected to a switching element (9), in particular a microswitch. The invention is distinguished in that the plunger (6) has a snap-action hook (7) at the other end, which communicates the three possible switch positions of the electromagnetic switching device to the switching element (9).
