Abstract (en)

[origin: EP2471402A1] The device has a hollow cylindrical cartridge (1) with a preset filling volume in which a high-viscous material is provided or inserted. The cartridge has inherent stability such that the material is discharged via an opening in the cartridge by a seal, where the opening passes into or connected with a nozzle-like structure (3). The nozzle-like structure has spaced extensions (7, 8) surrounding an outlet opening (2) for distributing the discharged material on a surface. The extensions are formed as spacers, and are provided at expansion of the structure.
