Abstract (en)  
[origin: WO2011029108A1] A device for aiding the mounting of an object on a wall, which device includes: a body shaped and configured to be held in abutment with a wall on which the object is to be mounted; an elongate member which is configured to extend outwardly from the body; a locating means which defines an opening for receiving the elongate member complementally therethrough and to allow displacement of the locating means along a substantially portion of the length of the elongate member; a mounting formation which is configured to extend outwardly the locating means, the mounting formation being configured to permit an object to be mounted on the wall to be mounted thereon; and a retaining means for retaining the locating means in a desired position on the elongate member, the retaining means comprising complementary male-and-female mating formations which are arranged on the elongate member and opening of the locating means.
