Abstract (en)

[origin: WO2010122243A1] The present invention relates to a prognostic molecular signature for sarcomas, and in particular for genetically complex sarcomas, and to the use thereof for predicting the overall survival of a patient, particularly for predicting the appearance of metastases but also for differentiating prognostically separate sub-groups within a group of tumors having the same histological grade. Said molecular signature can also be used for testing the effectiveness of a treatment or for producing novel therapeutic agents.
