Abstract (en)

[origin: WO2011023881A1] According to the invention, the nodes (N1-N8) of a communication network (2) implement a method for evaluating the collaboration among same. Said method, as implemented by a first node of the network, includes the following steps for transmitting a packet to a second node of the network: a step of encrypting data intended for a device (Serv) for estimating a collaboration level, said data including at least one counter representative of a number of prompts of the second node by the first node, said estimation device being capable of determining a collaboration level of the second node on the basis of at least said data; and a step of sending information to the second node, said sent information including the packet to be routed in said network and said data only in encrypted form. The second node then transmits all of the encrypted data received from the other nodes to the estimation device. The estimation device can then determine a collaboration level of said second node.
