Abstract (en)

[origin: WO2011036036A1] The invention relates to a motor-driven cutting device having a double blade arrangement driven by means of a double eccentric arrangement having opposing oscillating blade motions, comprising an advantageous construction having a separate double eccentric assembly for the drive device that can form a uniformly operable preliminary assembly, particularly in conjunction with the double blade arrangement, at a particularly favorable cost, and that is advantageous for installing in the preliminary assembly in the production process and/or when replacing the preferably uniformly operable preliminary assembly.
