Abstract (en)  
[origin: WO2011033096A1] The invention relates to a cleaning brush (1) having a bristle holder (2) and bristles (11) that are fastened to the bristle holder (2) and form a brush surface. The bristle holder (2) preferably has two limbs (10, 20). Known cleaning brushes have the disadvantage that they cannot reach all corners. The invention improves upon said problem in that the bristles (11, 21) fastened to the bristle holder (2) form a first, second and third sub-surface (T1, T2, T3) that together form the brush surface. The individual sub-surfaces (T1, T2, T3) are arranged such that they are each angled to one another, and preferably that a value of a first angle  $\alpha$  formed between the first and third sub-surfaces (T1, T3) differs from a value of a second angle  $\beta$  formed between the second and third sub-surfaces (T2, T3).
