Abstract (en)

[origin: WO2011031160A1] The invention relates to a device for arranging a sleeve-like foil envelope around an object, comprising supply means for supplying said sleeve-like foil envelope around at least one spreading element (190) in a horizontal orientation, as well as discharge means for discharging the sleeve-like foil envelope from the device and arranging it around the object, wherein said spreading element has an inlet side configured as a flat element portion (190a), an outlet side and a transition area (194) located between said inlet side and said outlet side, and wherein said spreading element widens towards the transition area in a direction perpendicular to the plane of the flat element portion, whilst the spreading element has an at least substantially constant circumference at least in the direction from the inlet side to the transition area.
