Abstract (en)

[origin: WO2011029763A1] A water-conducting household appliance (1), which is used in particular as a laundry treatment appliance for washing laundry, comprises a dosing device (11), a receptacle (6) that is used for storing at least one treatment substance, a treatment zone (16), a controller (14), and an input device (26). The input device (26) allows a basic dosed amount of the treatment substance that is stored in the receptacle (6) to be adjusted. Furthermore, the controller (14) controls the dosing device (11) during the program cycle in order to dose the treatment substance for the treatment zone (16) on the basis of at least the basic dosed amount of treatment substance. The input device (26) allows the receptacle (6) in which the treatment substance is stored to be directly selected in order to adjust the basic dosed amount of treatment substance, thus making it possible for a user to comfortably operate the water-conducting household appliance (1).
