Abstract (en)

[origin: EP2479037A1] The printing area (D) of to-be-printed containers (20) associated with base modules (29), is pressurized. The base modules are synchronously conveyed along with containers through a transport device (11). The base modules are accommodated corresponding to initial and end positions (AP,EP) on transport device. The containers are printed during synchronous movement of base modules between initial and positions of transport device. The base modules are transported opposite to transport direction (B) of transport device, and containers are transported along transport direction. An independent claim is included for circulating treatment module for printing on container.
