Abstract (en)
[origin: EP2479436A1] There is provided a multistage compressor that causes lubricating oil separated from an intermediate-pressure refrigerant gas by an oil separation plate to interfere with a stator coil end regardless of the height of a balance weight in which an oil separation plate is provided. The multistage compressor includes an electric motor (4) provided in a sealed housing (10); a low stage-side compression mechanism (2) and a high stage-side compression mechanism (3) which are provided under and over the electric motor (4), respectively, with the electric motor (4) being held therebetween; a balance weight (70) that is formed by a lower segment (71) and an upper segment (72) and assures rotational balance of a rotation shafting including a rotating shaft (7); and an oil separation plate (73) that centrifugally separates lubricating oil (12) contained in the refrigerant gas sucked into the high stage-side compression mechanism (3). On one end side of a rotor (6), the oil separation plate (73) is fixed to the rotor 6 by being held between the lower segment (71) and the upper segment (72).
