Abstract (en)

[origin: EP2479729A1] The method involves allocating a selected order to a transport case (16) by a central control unit (11) i.e. computer, which stores corresponding data. Transport bags (20, 22) are removed from a handling device (18) for handling value tokens that are removed from the bags according to the selected order, and introduced into the transport case. Data with information about the bags is transmitted to the control unit by the handling device over a data transmission link. The bags are assigned to the transport case and/or the selected order, and the data is stored by the control unit. The information about the bags is stored in a radio frequency identification (RFID) chip.
