Abstract (en)
[origin: US2012273160A1] An HVAC system for a construction vehicle is provided that includes a housing, a blower for circulating the air, at least one air duct for conveying the air, a coolant evaporator for cooling the air passed through the coolant evaporator, a heater for heating the air passed through the heater, a fresh air inlet opening, and a recirculating air inlet opening. The blower, the heater, and the coolant evaporator are disposed one above the other, so that only the blower or only the heater or only the coolant evaporator is cut through in a horizontal section, and/or the fresh air inlet opening and the recirculating air inlet opening are constantly open, so that exclusively fresh air and recirculating air is drawn in substantially simultaneously by the blower.
