Abstract (en)
[origin: WO2011067095A1] The lighting device (21) has a cooling body (2) with at least one receiving area (5), each area holding one printed circuit board (3), and a printed circuit board (3) introduced therein, said printed circuit board (3) having at least one light source (12) on a front face (10) and being at least in thermal contact with the cooling body (2) on a rear face (16). Each printed circuit board (3) has at least one rotational locking means that is engaged with a counter rotational locking means of the receiving area (5) for said printed circuit board. The method is used for assembling a lighting device (21) and has at least the following steps: inserting the at least one printed circuit board (3) into the corresponding receiving area (5) by an essentially linear feeding movement; and rotating the printed circuit board (3) against the cooling body (2).
