Abstract (en)

[origin: WO2011036379A1] The invention relates to a method for configuring the ringtone of a terminal (UB), which can be carried out by an application server placed across the flow on a signalling path in an IMS network. The invention comprises: a step (E20, E40) of receiving and sending a first call message intended for the terminal; a step (E80) of detecting a predetermined event; a step (E90) of waiting for a time period (T) counted from said detection; and a step (E100) of sending the terminal (UB), at the end of said time period (T), a second call message comprising information for defining a ringtone for said terminal (UB). The second call message is an INVITE message according to the SIP protocol.
