Abstract (en)

[origin: EP2482477A2] The method involves simultaneously receiving identical user data by two ground stations. The terminals receiving the configuration data are signalized that one of the ground stations is not in a position to potentially receive and/or to transfer user data transmitted by the terminals by the configuration data transmitted by one of the ground stations. The terminals receiving communication data is signalized that the other ground station potentially receives and transmits the user data transmitted by the terminals by the configuration data transmitted by the other ground station.
