Abstract (en)  
[origin: WO2011039609A1] An arrangement that is convertible from a vest to a carrying bag and back to a vest includes a body section, a strap section interconnected with the body section, a first zipper track that extends along a circumferential edge of the arrangement from a first end location to a second end location, and a second zipper track that extends along a circumferential edge of the arrangement from another first end location to the second end location. Zippers have respective sliders that are movable along a continuous path defined by the zipper tracks between the first end locations and the second end location. To facilitate rapid and simple conversion between a carrying or tote bag mode and any of a variety of vest modes, opposing rows of interlocking elements on the zipper tracks are joined together at all times at all locations between the first and second sliders on the continuous path.
