Abstract (en)
[origin: WO2011038958A1] The invention relates to a leadthrough capacitor (400) comprising an electrically insulating body (100) having a passage opening (110), wherein a wall of the passage opening of the body comprises an inner metallization. The body (100) further comprises an outer metallization. Furthermore, an electrically conductive intermediate member (200) is provided, which can be connected to an electric conductor (300) in an electrically conductive manner. The intermediate member (200) can be connected in the passage opening of the body (100) in an electrically conductive manner to the inner metallization.
