Abstract (en)
[origin: EP2484244A1] The link has two semi-links (2, 3) moved with respect to each other along a linear mobility direction (D) by engaging guide units, to form a captive assembly by engaging arresting units. One of the semi-links includes a longitudinal finger (23) with an elastic return locking unit (24) that is movable between folded-in and folded-out positions. The other semi-link includes a complementary elastic return locking unit engaged, in locking position, with the former locking unit in one of the positions. The locking units define two distant and discreet locking positions along the direction.
