Abstract (en)
A car frame main body that supports a cage has an upright that faces a guide rail that guides a car. An intermediate stopper that is disposed between the guide rail and the upright is disposed on an intermediate portion of the upright. A vibration damping member that has a predetermined vibration damping capacity is fixed to the upright so as to be parallel to a longitudinal direction of the upright. A reinforcing member that has higher rigidity than the vibration damping member is fixed to the vibration damping member. The vibration damping member is held between the reinforcing member and the upright.
