Abstract (en)
[origin: CA2774240A1] The invention relates to a clamping device, comprising a toggle mechanism (2) which is provided with a linearly movable control member (1) and a swivel shaft (23) for a clamping arm (21), means for releasing a position beyond the toggle point being associated with the toggle mechanism, wherein said means are formed by a control element (3) arranged on the control member (1) and a rocker (4) that can be brought into adjusting contact with the control element (3). According to the invention, the control element (3) is designed as a control extension when facing away from the swivel shaft, and the control member (1) is arranged between the swivel shaft (23) and the rocker (4).
