Abstract (en)

[origin: WO2011042544A1] The invention relates to a cooling system, in particular for an internal combustion engine, comprising a cooling circuit (1) for circulating a liquid coolant, and an equalization tank (2) connected to the cooling circuit (1) by means of an equalization line (3) during operation, said tank being arranged at least partially above the cooling circuit (1), wherein a filling line (4) for filling the cooling circuit (1) leads from a connection to a lower region of the cooling circuit (1), wherein the filling of the cooling circuit (1) and the equalization tank (2) via the filling line (4) can be blocked by an automatic blocking element (7, 9).
