Abstract (en)
[origin: WO2011045129A1] A trend toward lower washing temperatures in washing laundry has recently been established, because more and more effective detergents are available. This can result in increased germ load, however, in the residual water of the washing machine, for example. The invention relates to a washing or cleaning detergent having a specialized, microbicidal active ingredient, comprising a silver compound deposited on an inert, particulate carrier material and/or elementary silver deposited on an inert, particulate carrier material, which prevents increased germ load even at low washing temperatures.
