Abstract (en)
[origin: WO2011044980A1] The invention relates to a sabot (1), characterized by a complete, but at least partial structure made of a material foam, and to a method for producing such a sabot (1). The material foam can be metal foam such as aluminum foam, zinc foam, foaminal, etc., wherein the material foam can be used as a sandwich component having layers of the same or a different material, a reinforced fiber material such as carbon fibers, metal fibers, etc., and/or a core made of a different material. This provides a way of equipping parts of the surface of the sabot (1) with a different material than the rest of the body.
