Abstract (en)

A flip closure (10) for sealing a container comprises: - a first part (12) with an outer circumferential first sealing element (22), and - a second part (14) with an outer circumferential second sealing element (24), - the first part (12) connected to the second part (14) by a hinge (16) which allows rotational movement of one of the two parts (12,14) around an axis (17) into an open or a closed position of the flip closure (10), the first sealing element (22) providing, in the closed position, a form-fit with the second sealing element (24), - the second sealing element (24) being divided into a hinge region (26) and a non-hinge region (28), and having, in said non-hinge region, a height (30) greater than the height in the hinge region.
