Abstract (en)

A method for determining and displaying a floor level indication, indicating a floor at which a lift car is positioned in a lift shaft, said method uses an accelerometer for determining an acceleration/deceleration imposed on said lift car. On the basis of the measured acceleration/deceleration value the distance travelled by said lift car is determined. On the basis of said distance and a starting floor level indication a destination floor to which said lift car was moved as a consequence of said acceleration is determined.
