Abstract (en)

[origin: EP2489927A1] The case (1) has a bonding groove (2) engaged with a glass. A retaining element (3) i.e. latching lug, temporarily retains the glass on the case. The element is partially projected from the bonding groove. The bonding groove is formed between an inner edge (21) and an outer edge (22) of the case, where the outer edge partially encircles the inner edge. The element is formed on the outer edge facing an opening (23) of the inner edge. The element is inscribed in the opening when the opening and the element are observed along an axis (X) perpendicular to an opening plane (P). An independent claim is also included for a method for manufacturing a case.
