Abstract (en)
[origin: WO2011048344A1] The invention relates to a device for magnetic clasp at a plurality of points for a clothing accessory such as a belt, characterised in that said device includes at least one permanently magnetised assembly (13) arranged at one end of one surface of the accessory, while a plurality of ferromagnetic elements (17) and/or permanently magnetised assemblies (13) are arranged longitudinally on the other surface of the accessory at the opposite end thereof (3), the permanently magnetised assemblies of one surface being suitable for attracting a permanently magnetised assembly of the other surface, the permanently magnetised assemblies (13) and/or ferromagnetic elements (17) of each surface being arranged such that, by placing the ends of the two surfaces of the clothing accessory vertically adjacent to one another, a plurality of adjustment positions of the two surfaces are obtained relative to the position of the permanently magnetised assemblies (13) and ferromagnetic elements (17), representing a plurality of possible tightness levels, each permanently magnetised assembly of one surface engaging with a permanently magnetised assembly or a ferromagnetic element of the other surface in each one of the adjustment positions, in order to close any magnetic field.
