Abstract (en)
[origin: WO2011047704A1] The invention relates to a winding body (1) having a lateral face (2) for producing a coil winding. A retaining element (4a, 4b) is arranged on an inside (3) of the lateral face and the diameter of the lateral face can be specified by means of an overlap of end edges (5a, 5b) of the lateral face, wherein the overlap of the end edges in an overlap area (6) can be fixed relative to the retaining element by means of a fastening element (7a, 7b, 7c, 7d). Thus, it is possible to define a winding body for a coil winding to be wound that does not apply any corresponding pre-stresses to the coil winding as in the traditional chain tensioning technique.
