Abstract (en)

[origin: EP2492422A1] The mechanism has a key lock (14a) for achieving locked position in which a locking bolt opposes an opening of a flap panel (12) and an unlocked position, where the bolt authorizes the opening of the panel in the unlocked position. A retaining unit formed of retaining element and elastic return unit i.e. elastic compression spring, prevents the lock to return to the locked position. An activation unit formed of tooth and inclined ramp activates the retaining unit during the opening of the panel and deactivates the retaining unit when the panel is in closed position.
