Abstract (en)

[origin: EP2495151A1] The holding device (10) has chain links (11), end links (11a) and holding links (12) rotatably fastened to each other by rotary joints such that the chain links, the end links and the holding links form a link chain. The end links are rotatably fastened at a carrier device (14) by the rotary joints. A bracket firmly connects flexible connecting elements e.g. brake hoses (7), with the holding links. The connecting elements connect carriages (1) of a rail bound transportation unit. The carriages are pivoted against each other at a rotational axis and spaced at distance from each other. The links are formed as inner plate links and outer plate links. An independent claim is also included for a connection arrangement.
