Abstract (en)

[origin: WO2011055071A1] The invention relates to a device (D) for locking two adjacent backrests (DS1-DS2), which can be folded and have a frame (AD1-AD2), of a seat (SI) of a motor vehicle. Said device (D) includes a shaped rod (TC) rotatably mounted on an element (TP) of the motor vehicle in a location immediately adjacent to two adjacent portions (PA1-PA2) of the frameworks (AD1-AD2) when in the straight position, in order to adopt a locking position, in which said device prevents the forward rotation of either one of the two backrests (DS1-DS2) by retaining the portion (PA1-PA2) of the framework(s) (AD1-AD2) thereof, or an unlocking position, in which said device allows a forward rotation of either one of the two backrests (DS1-DS2) by releasing the portion (PA1-PA2) of the framework(s) (AD1-AD2) thereof.
