Abstract (en)  
[origin: WO2011054812A2] The turbomachine has a ring of radial blades (10) which are connected to an annular end wall (16). Situated on the end wall (16) upstream of each blade is a deflector wedge (20) with two divergent guide surfaces (21, 22). The deflector wedge generates pressure-side and suction-side vortices (30, 31) by means of which the vortices caused by the blade cascade are altered such that the transverse flow and backflow areas on the blade are reduced, and therefore the edge zone losses are decreased.
