Abstract (en)  
[origin: WO2011054351A2] The invention relates to an electric machine, comprising a housing having an inner circumference, a stator, which is inserted into the housing such that an outer circumference of the stator faces the inner circumference of the housing, wherein a clearance fit is formed between the inner circumference of the housing and the outer circumference of the stator, at least one fastening element, wherein each fastening element connects the stator to the housing in a form-fit manner such that the stator is retained on the housing in a rotationally-fixed manner, and a rotor, which is rotatably supported in the housing in a radial direction of the electric machine inwardly from the stator.
